WASTE IS NO LONGER i dirty word. On the commany, an increasing number of consumers, and hence paper-makers, can't seem to get enough of it. According to PPI statistics (see table), the world recovered almost 92 million tens of vastepaper in 1992, up from 87 million ons in 1991, and consumed 95.5 million ons, four million tons more than the previous year. The world's average utilization are has risen by two points to 39%.

From Arganina to Austria, and Mexico y Morecco, the latest reference lists from appliers (see above) show that mills are ill spending money on waste treatment stems, even during a time of severe cuncks in capital investment in the Industry, creasing environmental legislation and ingent quality requirements are demanded to the developments from manufactures of deinking equipment. This urticle mots up the latest news from some of the core major suppliers.

All agree that differences in customer rands in Europe and North Arcerica are rowing. Black Clawson, USA, reports

that US customers are beginning to look at the European approach to projects, looking for more liability from the supplier to make the system perform. "As more of these projects come under study, it is becoming apparent that the vendor's ability to provide special financing or equity participation is becoming as important as the technological issues that have always faced us," comments Black Clawson.

The parameters of evaluation from the customers' viewpoint are basically the same: All mills are seeking price performance, higher brightness, dire reduction, ash control and higher yields from their systems; no mean task for suppliers.

Customers want more for less

One of the major challenges facing suppliers of wastepaper treatment systems is that mills are using lower-quality and hard-to-delak waste while requiring ever-higher quality. As a result, according to Blank Clawson, research in the USA is focusing largely on the removal of diffichantle debris that is typically

grade office papers: unbleached fibers, last-printing inks. UV coatings and some dyed papers. The supplier adds that it is only a matter of time before the same concerns are transferred to system designers in the European and Asian markets.

Mills get into neutral gear

Neural deinking is being hailed as the latest breakthrough in waste treatment technology by Lamon of France. It says that the benefits of deinking in neural media are proving to be far beyond initial expectations, Such a solution is attractive because it requires less chemicals, so chemical oxygen demand is reduced and companies save on chemical costs. Suppliers to the industry say that controllability, drainage, pulp strength, bleachability and screening efficiency are all better than with conventional deinking techniques.

The Stephenson Group, UK, which supplies the ticking chemicals, agrees that demand for neutral deinking solutions and closed-water circuits is growing: Custom-

DEINKING SURVE . PTRADE

wastepaper for deinking, comments the company, and this is leading to problems with product quality (both brigheness and stickies), which the customer expects the supplier to solve.

In response, a considerable amount of resources is being invested in upgrading washing systems as part of a "complete ink removal" solution provided by a combined wash/floration system. Cost is the limiting factor, explains Stephenson, but work on the concept is continuing.

The first neural deinking system using household waste to make graphic pures is already in operation at Zwingen in Switzerland. The line started up last July and is the tesuit of a Joint project between the mill. Franch supplier Lamont, and Dr. W. Kolb. Lamont explains that since the process does not use sodium hydroxide, an efficient therefore trickion is imperative if grand ink removal is to be senseved at the pulping energy although post-floation is still available. Lamont recommends its Helico pulper for such applications.

Waste is floating on air Neutral floation is quite different to conventional deinking in that the ink particles adhere directly to the alr bubbles. Lamort explains. The foam structure of the cell is also completely different. Consequently, demand is growing for a floration coll which can handle an increased number of smaller bubbles and separate foam from fiber. Lamort's response is the Verticel which works on the concept of injection and has a controlled flow pattern.

Lamon says that Verticel has a foamremoval system which is particularly suited to neutral deinking.

Voith, Germany, is also continuing work on floration and has recently launched its new laboratory floration cell type E. a reduced version of the industrial unit. Five have already been suit!

Voith's floration machine consists of a mixing tank followed by primary and secondary stage being used to recover useful fibers from the overflow of the primary stage. Each stage is composed of tubular cells arranged in series, the number and size of which depend on the floration behavior of the printing inks and on the throughpur.

According to the supplier, the unit's

main advantages lie in maximum brightness with low energy consumption and an above-average purity of deinked stock, due to multiple, consistent, forced ventilation of each cell. Floration is accelerated because air supply is increased, requiring fewer cells, explains the supplier.

Black Clawson is working with its licensee in Japan. IIM, on the new IIMBC Florator flotation cell. According to
the supplier, the key to the unit's performance is its ability to mix uniformly high
volumes of ale into the stock slurry so
that maximum brighmess and dirt speck
temoval can be achieved. The sir bubbles
that are generated by the twin turbines in
each cell are evenly distributed across
the spectrum of sizes needed to optimize
particle-removal efficiency, from 5-500
incrons.

Black Clawson claims that the Flotator can improve hightness by 14 points in a single pass, and that it has shown improved speck removal efficiency, even with hard-to-denik grades such as laser-printed office papers or UV-coated grades. The supplier intends to market the Flocator unit on both sides of the Atlantic.
